Android studio install protobuf plugin

Example: dependencies { // You need to depend on the lite runtime library, not protobuf-java implementation 'com.google.protobuf:protobuf-lite:3.0.0' } protobuf { // You still need protoc like in the non-Android case } generateProtoTasks { all().each { task -> task.buildtools { // In most cases you don't need the full Java output // if you use the task output. cpp { } } task.plugins { // Add grpc output without any option. Customize generation tasks The Protobuf plugin generates a task for each protocol run, which is for a SourceSet in a Java project, or a variant in an Android project. // See --descriptor-set-out in the protoc documentation on what A@. task.descriptorSetOptions.includeImports = true } Change where files are generated by default generated Java files are under \$generatedFilesBasedir\$sourceSet/\$builtinPluginName, where \$generatedFilesBasedir is \$buildDir/generated/sources/PROTO by default, and is configurable. DOTS: Do not use the names of tasks, because they can change. } task.generateDescriptorSet = true // Allows you to override the default for the descriptor set task.descriptorSetOptions.path = "\${projectDir}/build/descriptors/\${task.sourceSet.name}.dsc" // If true, the descriptor set will contain .proto and line number comments. The Gradle plugin that compiles the Protocol Buffer (aka. Non-C ++ implementations of codegen plugins can be used if a constant classifier is specified (for example "com.example: example-generator: 1.0.0: -jvm8_32"). You can also run protoc with codegen plugins. Plugins: Code generation plugins that work with Protoc, for example, GRPC. There are two parts of your work: it rides the command line of the Protobuf (protoc) compiler and uses it to generate Java source files from your protoc files. // If you do not locate it, Protoc will attempt to use "Protoc-gen-GRPC" // system search path. // Do not omit the device if you want this construct to be added. See details in the default options section. The Protobuf files of a SourceSet (or variant in an Android project) are compiled in a single performance of Protoc, and the generated files are added to the Entry of the Java Compilation of this SourceSet (or variant). See the number 248. Protobuf) Definition files (* .Proto) in your project. A e 5%a a e oA A A A A A A oA A A A A A A a e o: 1. For more information about the Protobuf compiler, see the Google Developers website. You can customize it in the same way you would customize Java fonts. The last one wins. // if you have additional fonts, add them here: sourcedirs + = file (" / path / to / other / sources"): } Testing the TestProject * plugin are designs that use this plugin to compile .proto files. Apply plugin: 'Idea' Protobuf { ... // Locate the code plugins, plugins { // Locate a plugin with the name 'grpc'. It adds the Java source files generated to the corresponding Java compilation unit input (sourceSET in Java project; variant in an Android project), so they can be compiled together with their Java sources. To Versions from 3.0.x through 3.7.x, Lite code generation is provided as a Protoc plug-in (protobuf-lite). Since protobuf 3.0.0, the Lite runtime is the recommended ProtoBuf Library for Android. Include '** / *. protodevel' } java { ... } Customizing source directories The plugin adds a block of new sources called proto next to Java for all settonets. ProtoBuf { ... } Multiple tasks are allowed in the Protoc block. Put the options on the keys if you want. This example is configured with Gradle 4.10, the minimum version required. // This yields: "/ -cpp out = /path/to/output" in the protoc command. } The syntax for artefact follows artifact classifiers where the default classifier is project.osdetector.classifier (ie "\$ {project.osdetector.arch}") and the default extension is "EXE". A "A%aA%A% A%A%A_A± AA A , A .A± A± A% A%A , A% A% A%A%A , A% A% A%A%A , A%A%A , A%A%A , A%A%A , * * * / Sonorrences {pricipal {proto {srcdir 'src / main / proto' include '** / *. Proto' } Java {SRCDIR SRC / Main / Java } } } dependencies (Filetree implementation files (include: [* 'jar 'l, dir: 'libs'] implementation 'com.android.support:apcompat-v7:28.0_0-r02 'implementation 'com.android.support.constraint:constraint-layout: 1.1.2 'testImplementation 'junit:junit: 4.12 'androidtestImplementation' com.android.support.test:corridor: 1.0.2 'androidtestImplementation' com.android.support.test.espresso: espresso-core: 3.0.2 'Implementation files (' libs / fabric-sdkt-java-1.2.1-snapshot.jar') implementation files (' libs / log4j-1.2.17_ .jar implementation files ') (' libs / netty-all-4.1.29.final.jar') Implementation files (' libs / common-io-2.6.jar') Implementation files (' libs / bcpv-jdk14-160.jar') Implementation files (' libs / bcpix-jdk14-160.jar') Implementation files (' libs / protobuf.jar') Compile' com.google.protobuf: protobuf: protobuf-java: 3.1.0.3. You must configure these tas ks in the GenerateProtoTasks block, which provides auxiliary functions to conveniently access tasks that are linked to a certain and also ensures that the configuration will be correctly captured by the plugin. Note that if you are generating non-Java/Kotlin source files, they will not be included for compilation automatically, you will need to add them to the sources for language-specific builds. compilations.
